What do you want in a machine learning system?

- **Ease of expression**: for lots of crazy ML ideas/algorithms
- **Scalability**: can run experiments quickly
- **Portability**: can run on wide variety of platforms
- **Reproducibility**: easy to share and reproduce research
- **Production readiness**: go from research to real products
TensorFlow:
Second Generation Deep Learning System
If we like it, wouldn’t the rest of the world like it, too?

Open sourced single-machine TensorFlow on Monday, Nov. 9th

- Flexible Apache 2.0 open source licensing
- Updates for distributed implementation coming soon

http://tensorflow.org/
TensorFlow Mechanics 101

This is a technical tutorial, where we walk you through the details of using TensorFlow infrastructure to train models at scale. We use again MNIST as the example.

View Tutorial

Convolutional Neural Networks

An introduction to convolutional neural networks using the CIFAR-10 data set. Convolutional neural nets are particularly tailored to images, since they exploit translation invariance to yield more compact and effective representations of visual content.

View Tutorial

Vector Representations of Words

This tutorial motivates why it is useful to learn to represent words as vectors (called word embeddings). It introduces the word2vec model as an efficient method for learning embeddings. It also covers the high-level details behind noise-contrastive training methods (the biggest recent advance in training embeddings).

View Tutorial

Recurrent Neural Networks

An introduction to RNNs, wherein we train an LSTM network to predict the next word in an English sentence. (A task sometimes called language modeling.)

View Tutorial

Sequence-to-Sequence Models

A follow on to the RNN tutorial, wherein we assemble a sequence-to-sequence model for machine translation. You will learn to build your own English-to-French translator, entirely machine learned, end-to-end.

View Tutorial
Motivations

DistBelief (1st system):

- Great for scalability, and production training of basic kinds of models
- Not as flexible as we wanted for research purposes

Better understanding of problem space allowed us to make some dramatic simplifications
TensorFlow: Expressing High-Level ML Computations

- Core in C++
TensorFlow: Expressing High-Level ML Computations

- Core in C++
- Different front ends for specifying/driving the computation
  - Python and C++ today, easy to add more
TensorFlow: Expressing High-Level ML Computations

- Core in C++
- Different front ends for specifying/driving the computation
  - Python and C++ today, easy to add more
Automatically runs models on range of platforms:

from **phones** ...

to **single machines** (CPU and/or GPUs) ...

to **distributed systems** of many 100s of GPU cards
Computation is a dataflow graph

Graph of *Nodes*, also called *Operations* or *ops*.
Computation is a dataflow graph with tensors.

Edges are N-dimensional arrays: Tensors
Computation is a dataflow graph

'Biases' is a variable

Some ops compute gradients

−= updates biases

biases

... Add ...

Mul

learning rate

with state
Similar to Theano, TensorFlow can automatically calculate symbolic gradients of variables w.r.t. loss function.

```python
# Minimize the mean squared errors.
loss = tf.reduce_mean(tf.square(y-predict - y_expected))
optimizer = tf.train.GradientDescentOptimizer(0.01)
train = optimizer.minimize(loss)
```

Much easier to express complex and train complex models
Computation is a dataflow graph

Devices: Processes, Machines, GPUs, etc
Send and Receive Nodes

Devices: Processes, Machines, GPUs, etc
Send and Receive Nodes

Devices: Processes, Machines, GPUs, etc
Send and Receive Nodes

Devices: Processes, Machines, GPUs, etc
Send and Receive Implementations

- Different implementations depending on source/dest devices
- e.g. GPUs on same machine: **local GPU → GPU copy**
- e.g. CPUs on different machines: **cross-machine RPC**
- e.g. GPUs on different machines: **RDMA or RPC**
Extensible

- Core system defines a number of standard *operations* and *kernels* (device-specific implementations of operations)
- Easy to define new operators and/or kernels
Session Interface

- **Extend**: add nodes to computation graph
- **Run**: execute an arbitrary subgraph
  - optionally feeding in Tensor inputs and retrieving Tensor output

Typically, setup a graph with one or a few `Extend` calls and then `Run` it thousands or millions or times
Single Process Configuration

- **Client** to **Master** (session/run)
- **Worker** (GPU0, GPU1, ..., CPU0)
  - Execute subgraph
Distributed Configuration

- Client process
- Master process
- Worker process 1
- Worker process 2
- Worker process 3

RPC connections:
- Client process to master process
- Master process to worker processes

Resources:
- GPU0, GPU1, CPU0, etc.
Feeding and Fetching

Run(input={"b": ...}, outputs={"f:0"})
Feeding and Fetching

Run(input={"b": ...}, outputs={"f:0"})
TensorFlow Single Device Performance

</tr>
</tbody>
</table>

See [https://github.com/soumith/convnet-benchmarks/issues/66](https://github.com/soumith/convnet-benchmarks/issues/66)

Two main factors:
(1) various overheads (nvcc doesn’t like 64-bit tensor indices, etc.)
(2) versions of convolutional libraries being used (cuDNNv2 vs. v3, etc.)
## TensorFlow Single Device Performance

### Prong 1: Tackling sources of overhead

TensorFlow Single Device Performance

TODO: Release 0.6 this week improves speed to equivalent with other packages using cuDNNv2

Subsequent updates will upgrade to faster core libraries like cuDNN v3 (and/or the upcoming v4)

Also looking to improve memory usage
Single device performance important, but biggest performance improvements come from large-scale distributed systems with model and data parallelism
Experiment Turnaround Time and Research Productivity

- **Minutes, Hours:**
  - Interactive research! Instant gratification!

- **1-4 days**
  - Tolerable
  - Interactivity replaced by running many experiments in parallel

- **1-4 weeks**
  - High value experiments only
  - Progress stalls

- **>1 month**
  - Don’t even try
Transition

- How do you do this at scale?
- How does TensorFlow make distributed training easy?
Model Parallelism

- Best way to decrease training time: **decrease the step time**
- Many models have lots of inherent parallelism
- Problem is distributing work so communication doesn’t kill you
  - local connectivity (as found in CNNs)
  - towers with little or no connectivity between towers (e.g. AlexNet)
  - specialized parts of model active only for some examples
Exploiting Model Parallelism

On a single core: Instruction parallelism (SIMD). Pretty much free.

Across cores: thread parallelism. Almost free, unless across sockets, in which case inter-socket bandwidth matters (QPI on Intel).

Across devices: for GPUs, often limited by PCIe bandwidth.

Across machines: limited by network bandwidth / latency
Model Parallelism

(Sometimes) Local Receptive Fields

Layer N

Layer 1

Input data

Representation
Model Parallelism: Partition model across machines
Model Parallelism: Partition model across machines

Minimal network traffic:
The most densely connected areas are on the same partition
Data Parallelism

● Use multiple model replicas to process different examples at the same time
  ○ All collaborate to update model state (parameters) in shared parameter server(s)

● Speedups depend highly on kind of model
  ○ Dense models: 10-40X speedup from 50 replicas
  ○ Sparse models:
    ■ support many more replicas
    ■ often can use as many as 1000 replicas
Data Parallelism

Parameter Servers

\[ p += \Delta p \]

Model Replicas

Data

\[ \Delta p \]
Success of Data Parallelism

- Data parallelism is **really important** for many of Google’s problems (very large datasets, large models):
  - RankBrain uses 500 replicas
  - ImageNet Inception training uses 50 GPUs, ~40X speedup
  - SmartReply uses 16 replicas, each with multiple GPUs
  - State-of-the-art on LM “One Billion Word” Benchmark model uses both data and model parallelism on 32 GPUs
10 vs 50 Replica Inception Synchronous Training

Precision @ 1

50 replicas
10 replicas
10 vs 50 Replica Inception Synchronous Training

Precision @ 1

Hours

50 replicas
10 replicas

5.6 vs. 21.8 (3.9X)
19.6 vs. 80.3 (4.1X)
Using TensorFlow for Parallelism

Trivial to express both model parallelism as well as data parallelism

- Very minimal changes to single device model code
Devices and Graph Placement

- Given a graph and set of devices, TensorFlow implementation must decide which device executes each node
Full and Partial Device Constraints (Hints)

Devices are named hierarchically:

/job:localhost/device:cpu:0
/job:worker/task:17/device:gpu:3
/job:parameters/task:4/device:cpu:0

Client can specify full or partial constraints for nodes in graph:

“Place this node on /job:localhost/device:gpu:2”

“Place this node on /device:gpu:*”
Placement Algorithm

Given hints, plus a cost model (node execution time estimates and Tensor size estimates), make placement decisions

- Current relatively simple greedy algorithm
- Active area of work
Example: LSTM [Hochreiter et al, 1997]

- From research paper to code

\[
\begin{align*}
i_t &= W_{ix}x_t + W_{ih}h_{t-1} + b_i \\
j_t &= W_{jx}x_t + W_{jh}h_{t-1} + b_j \\
f_t &= W_{fx}x_t + W_{fh}h_{t-1} + b_f \\
o_t &= W_{ox}x_t + W_{oh}h_{t-1} + b_o \\
c_t &= \sigma(f_t) \odot c_{t-1} + \sigma(i_t) \odot \tanh(j_t) \\
h_t &= \sigma(o_t) \odot \tanh(c_t)
\end{align*}
\]

```python
def __call__(self, inputs, state, scope=None):
    """Long short-term memory cell (LSTM).""
    with vs.variable_scope(scope or type(self).__name__):  # "BasicLSTMCell"
        # Parameters of gates are concatenated into one multiply for efficiency.
        c, h = array_ops.split(1, 2, state)
        concat = linear([inputs, h], 4 * self._num_units, True)

        # i = input_gate, j = new_input, f = forget_gate, o = output_gate
        i, j, f, o = array_ops.split(1, 4, concat)

        new_c = c * sigmoid(f + self._forget_bias) + sigmoid(i) * tanh(j)
        new_h = tanh(new_c) * sigmoid(o)

        return new_h, array_ops.concat(1, [new_c, new_h])
```

Sequence-to-Sequence Model

Input sequence

\[ P(y_1, \ldots, y_{T'} | x_1, \ldots, x_T) = \prod_{t=1}^{T'} p(y_t | v, y_1, \ldots, y_{t-1}) \]

Target sequence

[Sutskever & Vinyals & Le NIPS 2014]
Example: LSTM

for i in range(20):
    m, c = LSTMCell(x[i], mprev, cprev)
    mprev = m
    cprev = c
Example: Deep LSTM

for i in range(20):
    for d in range(4):  # d is depth
        input = x[i] if d is 0 else m[d-1]
        m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
        mprev[d] = m[d]
        cprev[d] = c[d]
Example: Deep LSTM

for i in range(20):
    for d in range(4):  # d is depth
        input = x[i] if d == 0 else m[d-1]
        m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
        mprev[d] = m[d]
        cprev[d] = c[d]
Example: Deep LSTM

for i in range(20):
    for d in range(4):  # d is depth
        with tf.device("/gpu:%d" % d):
            input = x[i] if d is 0 else m[d-1]
            m[d], c[d] = LSTMCell(input, mprev[d], cprev[d])
            mprev[d] = m[d]
            cprev[d] = c[d]

TensorFlow Queues

Input prefetching
Grouping similar examples
Randomization/Shuffling
Example: Deep LSTMs

- Wrinkles
  - Bucket sentences by length using a queue per length
  - Dequeue when a full batch of same length has accumulated
  - N different graphs for different lengths
  - Alternative: while loop
Expressing Data Parallelism

# We use the ReplicaDeviceSetter() device function to automatically
# assign Variables to the 'ps' jobs.
with tf.device("/cpu:0"):
    # Create the Mnist model.
    model = MnistModel(batch_size=16, hidden_units=200)

    # Get an initialized, and possibly recovered session.
    sess = tf.Session()

    # Train the model.
    for local_step in xrange(FLAGS.max_steps):
        _, loss, step = sess.run([model.train_op, model.loss, model.global_step])
        if local_step % 1000 == 0:
            print "step %d: %g" % (step, loss)
Expressing Data Parallelism

# We use the ReplicaDeviceSetter() device function to automatically
# assign Variables to the 'ps' jobs.
with tf.device(tf.ReplicaDeviceSetter(parameter_devices=10)):
    # Create the Mnist model.
    model = MnistModel(batch_size=16, hidden_units=200)

    # Create a Supervisor. It will take care of initialization, summaries,
    # checkpoints, and recovery. When multiple replicas of this program are running,
    # the first one, identified by --task=0 is the 'chief' supervisor (e.g., initialization, saving)
    supervisor = tf.Supervisor(is_chief=(FLAGS.task == 0), saver=model.saver)

    # Get an initialized, and possibly recovered session.
    sess = supervisor.PrepareSession(FLAGS.master_job)

    # Train the model.
    for local_step in xrange(int32_max):
        _, loss, step = sess.run([model.train_op, model.loss, model.global_step])
        if step >= FLAGS.max_steps:
            break
        if local_step % 1000 == 0:
            print "step %d: %g" % (step, loss)
Asynchronous Training

- Unlike DistBelief, no separate parameter server system:
  - Parameters are now just stateful nodes in the graph
Synchronous Variant

Parameter Device(s)

Add → Update → P

ΔP

Device A

model

input

Device B

model

input

Device C

model

input

Synchronous Data Parallelism
Network Optimizations

- Neural net training very tolerant of reduced precision
- e.g. drop precision to 16 bits across network
Network Optimizations

- Neural net training very tolerant of reduced precision
- e.g. drop precision to 16 bits across network
Subgraph Compiler

- Compile small subgraphs together to generate optimized routine
- Dynamic compiler with caching so sizes are known
Quantization for Inference

- Need even less precision for inference
- 8-bit fixed point works well, but many ways of quantizing
- Critical for things like mobile devices
  - w/quantization, high-end smart phone can run Inception model at >6 frames per second (fps)
Open Source Status for Distributed TensorFlow

Multi GPU in single machine already in open source release

- See 4-GPU CIFAR10 training example in repository

Distributed implementation coming soon:

- GitHub tracking issue: [github.com/tensorflow/tensorflow/issues/23](http://github.com/tensorflow/tensorflow/issues/23)
Concluding Remarks

- Model and Data Parallelism enable great ML work:
  - Neural Machine Translation: ~6x speedup on 8 GPUs
  - Inception / Imagenet: ~40x speedup on 50 GPUs
  - RankBrain: ~300X speedup on 500 machines
- A variety of different parallelization schemes are easy to express in TensorFlow
Concluding Remarks

- Open Sourcing of TensorFlow
  - Rapid exchange of research ideas (we hope!)
  - Easy deployment of ML systems into products
  - TensorFlow community doing interesting things!

Reinforcement Learning using Tensor Flow

Quick start

Check out Karpathy game in notebooks folder.

The image above depicts a strategy learned by the DeepQ controller. Available actions are accelerating top, bottom, left or right. The reward signal is +1 for the green fellas, -1 for red and -5 for orange.
"Neural Art" in TensorFlow

An implementation of "A neural algorithm of Artistic style" in TensorFlow, for

- Introductory, hackable demos for TensorFlow, and
- Demonstrating the use of importing various Caffe cnn models (VGG and illustration2vec) in TF.

In this work, I put effort in putting the code simple as possible, for being a good introductory code to TF. For this reason, I also implemented very basic uses of TensorBoard (the visualizer). I also aimed on demonstrating the use of importing various Caffe models from *.caffemodel files into TensorFlow, especially models that seemed not to be imported by anybody yet in TF (as far as I know). Based on https://github.com/ethereon/caffe-tensorflow, I modified the importer so that it can import illustration2vec (http://illustration2vec.net/), which is another CNN available as a Caffe model. Using different CNNs yields different results, which reflects the characteristics of the model.

In the Neural Art problem setting, the weights of the CNN are fixed, and the input image into the CNN is the only "trainable" variable, making the code easy to understand (the optimized/trained image is the output image). I hope this example serves as a good introduction to TensorFlow as well as for entertainment purposes.
char-rnn-tensorflow

Multi-layer Recurrent Neural Networks (LSTM, RNN) for character-level language models in Python using Tensorflow.

Inspired from Andrej Karpathy's char-mn.

Requirements

- Tensorflow

Basic Usage

To train with default parameters on the tinyshakespeare corpus, run `python train.py`.

To sample from a checkpointed model, `python sample.py`.
Keras: Deep Learning library for Theano and TensorFlow

You have just found Keras.

Keras is a minimalist, highly modular neural networks library, written in Python and capable of running either on top of either TensorFlow or Theano. It was developed with a focus on enabling fast experimentation. Being able to go from idea to result with the least possible delay is key to doing good research.

Use Keras if you need a deep learning library that:

- allows for easy and fast prototyping (through total modularity, minimalism, and extensibility).
- supports both convolutional networks and recurrent networks, as well as combinations of the two.
- supports arbitrary connectivity schemes (including multi-input and multi-output training).
- runs seamlessly on CPU and GPU.

Read the documentation at Keras.io.

Keras is compatible with: - Python 2.7-3.5 with the Theano backend - Python 2.7 with the TensorFlow backend
Neural Caption Generator

  - Borrowed some code and ideas from Andrej Karpathy's NeuralTalk.
- You need flickr30k data (images and annotations)

**Code**

- make_flickr_dataset.py : Extracting feats of flickr30k images, and save them in './data/feats.npy'
- model_tensorflow.py : TensorFlow Version
- model_theano.py : Theano Version

**Usage**

- Flickr30k Dataset Download
- Extract VGG Features of Flicker30k images (make_flickr_dataset.py)
- Train: run train() in model_tensorflow.py or model_theano.py
- Test: run test() in model_tensorflow.py or model_theano.py.
  - parameters: VGG FC7 feature of test image, trained model path
你正在翻译的项目可能会比 Android 系统更加深远地影响着世界！

缘起

2015年11月9日，Google 官方在其博客上称，Google Research 宣布推出第二代机器学习系统 TensorFlow，针对先前的 DistBelief 的短板有了各方面的加强，更重要的是，它是开源的，任何人都可以用。

机器学习作为人工智能的一种类型，可以让软件根据大量的数据来对未来的情况进行阐述或预判。如今，领先的科技巨头无不在这机器学习下予以极大投入。Facebook、苹果、微软，甚至国内的百度、Google 自然也在其中。「TensorFlow」是 Google
Google Brain Residency Program

New one year immersion program in deep learning research

Learn to conduct deep learning research w/experts in our team

- Fixed one-year employment with salary, benefits, ...
- Goal after one year is to have conducted several research projects
- Interesting problems, TensorFlow, and access to computational resources
Google Brain Residency Program

Who should apply?

● people with BSc, MSc or PhD, ideally in CS, mathematics or statistics
● completed coursework in calculus, linear algebra, and probability, or equiv.
● programming experience
● motivated, hard working, and have a strong interest in deep learning
Google Brain Residency Program

Program Application & Timeline

DEADLINE: January 15, 2016

- Applications Open! Oct 22 2015 - Jan 15 2016
- Phone & Onsite Interviews
- Applications Review: Selected candidates will be contacted in February for interviews
- Application Result Announcement!
- Program Start & Orientation! June 6 2016
Google Brain Residency Program
